MMPI profile characteristics of Kentucky prison inmates.

 Abstract: "A nomothetic analysis of 370 Kentucky prison inmates shows a mean MMPI profile with major peaks at subscales 4 and 9 (psychopathic deviate and hypomania) . . . Interpretation of the mean profile shows the average inmate to be overactive, irritable, talkative, and stubborn-hostile with a moderate psychopathic flavor. There is an absence of neurotic anxiety, a few somatic concerns, sensitivity to others' opinions, a dissatisfaction with interpersonal relationships and a tendency toward abstract interests." Irritable bowel syndrome (IBS)
Fibromyalgia
Lupus
Lyme disease
Endometriosis

What it is: A chronic disorder of the large intestine. An estimated 10 to 15 percent of adults suffer from it, though only 5 to 7 percent have a diagnosis.

What it's mistaken for: IBS symptoms include bloating, abdominal pain, diarrhea and/or constipation—all of which are also associated with other conditions, such as inflammatory bowel disease, celiac disease and colon cancer. It can even be confused with gyno problems, such as PMS or endometriosis.

How to nail down a diagnosis: There's no standard test for IBS, but if your symptoms have been persistent (occurring for at least six months—and at least three days a week), a good doctor will put the pieces together by using a "diagnosis of exclusion." That may mean doing blood work, getting stool
